*Research suggests that mathematical problem solving processes look essentially the same at any age and young children employ similar strategies to older ones: it is experience rather than age which makes a difference, according to Askew and Wiliam (1995). At the different stages in the process, successful problem solvers' strategies include: getting a feel for the problem, looking at it ...*

*Computational thinking is a problem-solving process in which the last step is expressing the solution so that it can be executed on a computer. However, before we are able to write a program to implement an algorithm, we must understand what the computer is capable of doing -- in particular, how it executes instructions and how it uses data. This module describes the inner workings of a modern ...*

*A mathematical formula is a good example of a problem-solving algorithm. While an algorithm guarantees an accurate answer, it is not always the best approach to problem-solving. This strategy is not practical for many situations because it can be so time-consuming. For example, if you were trying to figure out all of the possible number combinations to a lock using an algorithm, it would take ...*

*Problem Solving: Choose the Operation What Is It? The process of "choosing the operation" involves deciding which mathematical operation (addition, subtraction, multiplication, or division) or combination of operations will be useful in solving a word problem.
